

Figure 2.8.1 Cable Installation

For best results your amplifier should be attached to a good earth ground by as short a length, and as large as possible, ground strap. A ground post is provided on the rear panel for this purpose. It is always a good idea to connect the chassis of all associated equipment together and ground them at one point to avoid ground loops. We recommend that all of the equipment in your station be connected together and grounded at the antenna tuner.
